Edunet Foundation

Year - 2026

ACKNOWLEDGEMENT

I want to thank, firstly, my supervisor, along with my Edunet mentors, Aman Sir, Hrishikesh Sir, Medini Ma'am, Uma Ma'am, and Sagar Sir for their valuable guidance and consideration towards me while I worked on this project. Their feedback was invaluable during the process of building my project.

I would also like to extend my sincere thanks to the entirety of the Edunet Foundation, Microsoft, LinkedIn, and SAP for giving me the platform to build my technical skills in AI and data analysis alongside my mass media background, not despite it, through this wonderful fellowship.

I would also like to thank my peers, whose curiosity and helpfulness inspired me to work as hard and stay as enthusiastic as they did throughout the course of this fellowship.

Last but not least, I want to extend my thanks to my parents, my idols in STEAM tech, and my friends who inspired me to take up this fellowship and explore new possibilities.

ABSTRACT OF THE PROJECT

This project is part of the AICW (Artificial Intelligence in the Contemporary World) Fellowship Program, a collaborative initiative by Edunet Foundation in partnership with Microsoft, LinkedIn, and SAP. The fellowship is designed to equip students with practical, hands-on skills in Artificial Intelligence, Data Analytics, and Business Intelligence tools.

Abstract

Navigating the expansive landscape of the marketing industry presents a significant challenge for early-career professionals and recent graduates. These individuals frequently encounter a lack of structured guidance regarding specific career trajectories, practical project execution, and the optimization of resumes for modern Applicant Tracking Systems (ATS). This project sought to address this critical knowledge gap by developing a comprehensive, AI-driven career coaching solution. The primary objective was to engineer a conversational platform capable of providing tailored career advice and generating clear, highly polished resume templates founded on the proven XYZ framework (Accomplished [X] as measured by [Y], by doing [Z]).

To achieve this, the project utilized Microsoft Copilot Studio to develop the chatbot infrastructure, integrating the advanced natural language processing capabilities of Claude 4.6 Sonnet and Google Gemini. The foundational knowledge base was structured using a comprehensive Microsoft Excel dataset containing detailed marketing job roles, industry-specific constraints, and entry-level project concepts.

The key result of this initiative is a highly functional, interactive chatbot that delivers customized, criteria-based information on marketing careers. Users can dynamically access strategic guidance on job roles, relevant project suggestions to build their portfolios, and actionable advice on crafting ATS-optimized resumes.

In conclusion, as artificial intelligence continues to reshape the professional landscape, leveraging these emerging technologies is paramount for empowering young professionals with the clarity and confidence required for career advancement. This project demonstrates the efficacy of AI-assisted career coaching within the marketing sector. Future iterations of this platform aim to broaden its scope to encompass both linear and non-linear career paths across a wider array of industry domains. This expansion will be facilitated by integrating live web-scraping capabilities and larger, dynamic datasets, thereby providing real-time, comprehensive career intelligence to a broader workforce.

CHAPTER 1

Introduction

This chapter covers the inception of “Smokey.io – a key to a better portfolio,” my flagship project undertaken as part of my AICW fellowship program. Smokey.io started with my own frustration of building without a blueprint in an age where skills matter more than degrees, and AI persists as a “job-killer” rather than a buzzword. Smokey.io is my answer to skill-building, using AI (Co-pilot agent and Gemini AI) to build a Portfolio enhancer + Project builder chatbot that empowers young marketers with polished resumes and project ideas that foster collaboration and execution better than simply making specs for social media.

1.1 Problem Statement

The Core Problem:

Marketing has the reputation of being the “flexible “ career option, with young aspirants coming from different backgrounds of study, levels of experience, and passion for different domains within the realm of marketing. Young grads may get stuck in roles that come with the name tag of marketing: social media management, getting sponsors/subscribers, making content, but are miles different from the actual work they want to do - product marketing, performance marketing, personal branding, and so on.

For a young graduate, it can be difficult to position themselves for their dream marketing career path for two key reasons:

1. They don't know what makes a killer marketing profile: relying on resumes that don't show their impact, just their tasks. With ATS-backed screening and search for talent that can identify what KPIs are, companies look beyond generic keywords - creating a need to optimize resumes.
2. They don't know how to start building projects with real-life impact, and build substantial projects that not just look good in resumes but spark conversations, open doors to opportunities they didn't know existed.

Target Users: Smokey.io is built for marketing freshers, junior agency marketers, and recent graduates trying to break out of the “social media manager” stereotype and into specialized disciplines (SEO, Product Marketing, Performance Marketing, CRM).

Limitations of Existing Tools: Traditional resume builders only fix formatting, do not give clarity, or guidance on what to do beyond writing impactful, ATS-friendly bylines. Furthermore, there are no existing AI tools that guide a marketer in making decisions on *what* specific mock projects they should build in their preferred marketing subcategory or industry domain, based on key KPIs and core constraints prevalent in the profession.

1.2 Motivation

Personal & Professional Meaning:

“What makes a good resume/portfolio?” It is a question that is passed from generation to generation in my college, and probably in every college. From a freshman starting college to a senior getting ready to get into corporate, everyone wants to know how to build a resume and portfolio that gets them selected.

Navigating the entry-level jobs landscape is a difficult journey in itself - often plagued by imposter syndrome, confusion, and lack of clarity. Yet for marketing, there's no such clear path - especially for young aspiring marketers like me who want to venture beyond social media and digital content creation. I chose this project to demonstrate deep user empathy by solving real anxiety for my peers and for myself. Simultaneously, it allows me to showcase my own understanding of complex marketing operations—proving I know the difference between a Brand Marketer's output and a Growth Marketer's metrics—while building a practical AI solution.

Real-World Applications:

Job seekers are many, but positions are scarce. Smokey.io, as a conversational marketing career guide chatbot, can aid young professionals to start mapping out their career paths, giving ideas for resume optimization and projects that can help young marketers boost their portfolio, aid in skill-building, and overall job eligibility.

In a business context, a chatbot like this acts as a powerful Product-Led Growth (PLG) asset. It could be deployed by a marketing agency, an educational boot camp, or a recruiting firm as a high-value lead-generation magnet to capture candidate emails. I myself want to build this as a predecessor for my portfolio matching app [Smokey.io](#), to create a profile beyond simple Canva-based social media design and digital content.

Domain Impact: This project democratizes access to high-tier career positioning, teaching junior marketers how to think about their daily work in terms of measurable business value and strategic revenue generation to highlight in their resumes AND create worthwhile projects, helping them not just be job ready but also enhance their skills in a job market where people are recruited for what skills they bring to the table and not just their degrees.

Alignment with Industry Trends: This project perfectly aligns with the industry shift toward "Micro-Utility AI"—building highly specialized, prompt-engineered bots that solve one specific workflow bottleneck exceptionally well, rather than relying on generalized, unfocused AI chat interfaces. Also, PLG is utilized as a common marketing hook by founders and creators to attract potential users to their main project- be it their own personal brand or their startup.

1.3 Objectives

- To collect and understand the structure of the dataset used in the project, mapping generic marketing tasks to role-specific ATS keywords and aligning marketing domains with high-value portfolio deliverables.
- To clean and preprocess raw data by removing duplicates, correcting formats, and handling missing values within datasets of 200 projects and jobs and 100 resume byline datasets.
- To apply domain-specific analysis using Excel to categorize marketing niches (e.g., Demand Gen, Product Marketing, SEO, Lifecycle Marketing).
- To leverage AI tools (Copilot and Gemini) to automate the content generation process, strictly formatting resume outputs to the "Google XYZ Resume Formula" (Accomplished [X] as measured by [Y], by doing [Z]).

- To expand the chatbot's utility by generating role-specific "Portfolio Blueprints," providing users with actionable, non-social-media project briefs (e.g., Competitor Battlecards, Churn-Rescue Workflows) to build out their professional portfolios.
- To design, prompt-engineer, and test an interactive chatbot interface that successfully translates raw user input into both KPI-driven resume bullets and strategic portfolio project recommendations tailored to a chosen marketing sub-niche.

1.4 Scope of the Project

- **Data Boundaries:** This project covers data from a curated dataset of 200+ entry-level marketing tasks, paired with ATS keyword requirements and strategic project blueprints for resume and career building in marketing.
- **Tooling:** The tools used are limited to Excel (for dataset structuring), Gemini (for synthetic data generation and prompt engineering), and Copilot (for workflow assistance and documentation).
- **Focus Area:** The analysis focuses on prompt engineering, dataset curation, and conversational AI user experience (UX) for career development and content generation.
- **Exclusions:** The project does not include real-time ATS integration, live job board scraping, API deployment to a live website, or predictive machine learning models for hiring success.
- **Intended Use:** The project is intended as a fellowship showcase to demonstrate applied AI, deep marketing strategy, and user empathy; it is not a production-level enterprise system

CHAPTER 2

Literature Survey

A literature survey reviews existing research, tools, and methodologies relevant to the project domain. It helps identify gaps that the current project aims to address.

2.1 Existing Work and Research

- **Traditional Resume Builders:** Existing platforms (e.g., Zety, Canva, Novoresume) focus heavily on aesthetic formatting and layout rather than content strategy. They do not teach users *how* to write impact-driven bullet points specific to the domains/industries marketing freshers target.
- **General Purpose AI:** While many candidates use ChatGPT to write resumes, research into AI prompt engineering shows that "zero-shot" prompting (asking AI to write a resume without providing a strict persona, framework, or dataset) results in robotic, generic, and easily detectable outputs that fail Applicant Tracking Systems (ATS).
- **Marketing Career Education:** Current literature and boot camps emphasize basic social media skills for entry-level talent, leaving a significant knowledge gap regarding high-value, revenue-driving disciplines like Demand Generation, Product Marketing, and Lifecycle Marketing.
- **Current career building resources** don't provide end-to-end solutions for marketing, and do not encourage or brief potential candidates on the projects they can do based on the skills, KPIs and core constraints they would likely face in that job role specific to the niche or industry they will be working in.

2.2 Tools and Technologies Review

- **Microsoft Copilot and Gemini (AI):** Generative AI tools used for prompt-driven content creation. In this project, both Gemini and Copilot are utilized both in the backend (to synthetically enrich the Kaggle datasets) and as the frontend conversational interface for the user.
- **Kaggle:** An online community of data scientists and machine learning practitioners, used in this project to source real-world, raw resume data and job description keywords.

2.3 Gaps Identified

- Most existing AI resume tools are "domain-agnostic," meaning they give the same generic advice to a software engineer as they do to a B2B marketer. There is a gap for highly specialized, niche career copilots.

- There is limited documentation on what specific skills, and projects marketers can target for their specific roles, in a specific domain or industry and limited existing knowledge is fragmented, spread across various sources.
- No existing tool bridges the gap between *resume optimization* and *portfolio creation*. Current tools fix past experience, but fail to tell freshers *what* mock projects they should build next to prove business acumen.

CHAPTER 3

Proposed Methodology

This chapter describes the methodology adopted to achieve the project objectives. It covers the system design, modules used, data flow, advantages, and requirement specifications.

3.1 System Design

- **Data Source / Input:** Raw resume datasets containing thousands of unoptimized bullet points sourced from Kaggle, alongside synthetically generated B2B Marketing Portfolio Blueprints.
- **Data Cleaning:** Using Microsoft Excel to filter the dataset specifically for marketing roles, removing duplicates, deleting irrelevant industries, and standardizing the columns (Weak Task, Target Role, ATS Keyword).
- **Analysis / Processing:** Applying advanced AI Prompt Engineering to process the cleaned data. The AI acts as a data enricher, translating the "Weak Tasks" into the "Google XYZ Formula" (Accomplished [X] as measured by [Y], by doing [Z]).
- **Visualization / Output:** An interactive conversational chatbot interface (deployed via Copilot Studio or ChatGPT Custom GPT) that acts as a Career Copilot, outputting tailored resume bullets and highly specific B2B portfolio project briefs.

3.2 Modules / Components Used

- **Module 1 — Data Ingestion & Structuring:** I downloaded the Kaggle dataset using keywords "job resume", "resume", "marketing resume", and downloaded a raw 356-cell dataset dated March 2026. This dataset had both non-technical and technical jobs.
- **Module 2 — Data Cleaning:** Non-marketing jobs were removed, salary and company names were removed, Skills requirements were added.
- **Module 3 — AI Data Enrichment:** The original dataset was lacking in responses, and additional columns such as project categories, resume bullet points, company size, and industry domain – which were added by generating synthetic data using Gemini AI.

- Module 4 — Bot Configuration (Prompt Engineering): The bot's intent and instructions were structured by me and refined in Gemini AI before filling them into CoPilot Studio.
- Module 5 — AI Integration: Connecting the CSV Knowledge Base to the chatbot so it uses Retrieval-Augmented Generation (RAG) to provide accurate, dataset-backed answers.

3.3 Data Flow Diagram (DFD)

DFD Level 0 — Context Diagram

As seen in the diagram, the user types in query based on their preferred topic (job/resume/project), which is processed by CoPilot. If the query is clear and uses the specific keywords mentioned in the workflows and the .csv knowledge bases, Smokey proceeds to provide relevant information on the topic based on the specific dataset and formulates its answer based on further user inputs (selected option).

DFD Level 1 — Detailed Process Flow

The real interaction begins when a user submits a query, such as a request for resume help (can be anything from the three topics of job, project and resume). The Copilot agent processes this input by identifying the user's intent and extracting relevant parameters. If the intent is unclear, the system prompts the user for clarification. (For the resume and project, this reiteration is built into the workflow to ensure that the chatbot can easily identify the keyword it is required to process.) Once the intent is confirmed, the system retrieves relevant data from structured datasets (projects, resume optimization, and jobs). It then extracts key insights such as skills, constraints, and requirements, which are used to construct a structured reply. The system generates a personalized response using predefined formatting and logic, delivering tailored outputs like

resume improvements, job suggestions, or project ideas. Finally, the system allows for follow-up interactions, enabling iterative refinement of the output based on user feedback.

Figure DFD 1

3.4 Advantages

- Automates high-tier career coaching, saving significant manual effort and consulting costs for junior marketers.
- Provides clear, metric-driven outputs that directly improve a candidate's chances of passing ATS filters.
- Leverages structured datasets (through RAG) to ensure the AI provides specific, job-focused advice rather than generic fluff.
- Scalable — the same methodology can be applied to other niches (e.g., a Copilot specifically for entry-level Data Analysts or HR professionals).

- Cost-effective — uses widely available tools (Excel, ChatGPT, Copilot).

3.5 Requirement Specification

Hardware Requirements

Component	Specification
Processor	Intel core i7
RAM	Minimum 4 GB (8 GB recommended)
Storage	Minimum 50 GB free disk space
Display	1366 x 768 resolution or higher
Internet	Required for Copilot / Chatbot access

Software Requirements

Software	Details
Operating System	Windows 11
Microsoft Excel	Microsoft 365 (Excel with Copilot)
Microsoft Copilot	Integrated via Microsoft 365 subscription
AI Chatbot	Google Gemini and Microsoft Copilot (web)
Web Browser	Google Chrome and Microsoft Edge (latest version)

CHAPTER 4

Implementation and Results

This chapter presents the actual implementation of the project and the results obtained at each stage.

4.1 Data Cleaning Results

- Dataset source: Raw resume dataset downloaded from Kaggle, supplemented by synthetic data generation for portfolio projects and resume outlines.
- Original dataset size: 365+ rows of mixed-industry resume data.
- Issues found: The raw data contained irrelevant industries (e.g., web developer, programmer), formatting inconsistencies, and heavily task-based, weak descriptions lacking metrics.
- Cleaning steps applied: Filtered Excel rows by keywords ("Marketing", "Social Media", "SEO"). Removed null values. Extracted exactly 40 "weak" marketing tasks to serve as the baseline input.
- Cleaned dataset size: A highly focused, dual-CSV knowledge base (200+ rows of Job, Project, and 100 Resume Blueprints).

- Figure 1: Raw dataset

Job Role	Category	Domain/Industry	Company Size	Job Description	Required Skills
Sales Executive	Sales	Tech/B2B SaaS	Startup	Drive new revenue through outbound prospecting and closing deals.	Cold calling, Salesforce
Account Manager	Sales	Beauty/Cosmetics	Mid	Manage relationships with key retail distributors and salons.	Relationship building, C
Business Development Associate	Sales	EdTech	Small	Identify and secure institutional partnerships with schools and universities.	B2B Sales, Pitching, M Negotiation
Inside Sales Specialist	Sales	Tech/SaaS	Startup	Handle inbound leads and qualify them for Account Executives.	HubSpot, Lead Qualific Outreach
Jr Product Marketing Manager	Product Marketing	Tech/SaaS	Large/Listed	Lead the go-to-market strategy for new enterprise software features.	Positioning, Market Re Leadership
Associate Product Marketer	Product Marketing	FinTech	Startup	Support the PMM team with collateral creation and market research.	Copywriting, Competito
Technical Product Marketer	Product Marketing	Tech/Cloud	Mid	Translate complex API features into developer-friendly marketing.	Technical Writing, API Strategy
Brand Marketing Specialist	Product Marketing	Beauty/Cosmetics	Small	Maintain brand voice and launch awareness campaigns for new skincare lines.	Brand Strategy, Influen Planning

Details (Edit)

Name: Smokey

Description: Smokey is a career-helper chatbot for young marketing aspirants and professionals. It helps refine resume bylines into polished ATS-optimized content and provides recommendations for innovative self-projects users can pick up according to their dream marketing career path - be it SEO, Product, Branding, Performance, Influencer/Celebrity.

Select your agent's model: Your agent will primarily use the model for reasoning and responding. Experimental models are subject to [preview terms](#). [Learn more](#)

Claude Sonnet 4.5

Instructions: Your name is Smokey, a friendly, encouraging, and informative Career Copilot dedicated to helping young marketing professionals bridge the gap between task-based internships and activities they have done and

Test your agent

Hello, I'm Smokey. How can I help?

Just now

Ask a question or describe what you need

0/2000

You're testing your agent's real responses and capabilities. [Find troubleshooting help here](#). Make sure AI-generated content is accurate and appropriate before using. [See terms](#)

In this project, the "Outputs" are the structured textual outputs generated by the interactive chatbot. (Please note outputs aren't in order of execution done during testing. For testing a linear flow of jobs- project-resume was used)

- Output 1: The XYZ Resume Translation: The bot successfully takes a user input like “*I need resume advice*” and, *based on the selected option (job/industry or domain), gives a specific, curated answer as trained on the dataset. For eg: For specific domain, it gives the list of all the jobs in the domain, and the KPIs related to them, and examples of good and bad resume lines.*
- Output 2: The Portfolio Blueprint: When asked for a project idea based on the option “Job Role”, “Fintech”, the chatbot gives a brief description of the role, solo and group project ideas, and also pro-tips that the user can apply.
- Output 3: The Job advice: When asked for job advice on a specific industry or domain (eg:specific industry – Fintech), it gives curated roles, along with their day-to-day responsibilities, core constraints, and skills required for the role.
-

4.3 AI Tool Integration Results

- Tool used: Microsoft Copilot / ChatGPT.
- Prompts used: The core integration relied on a Master System Prompt: *"Role: You are an elite B2B Marketing Recruiter. Directives: 1. Always prioritize the uploaded CSV Knowledge Base. 2. Translate tasks into the Google XYZ formula. 3. Recommend strategic B2B projects (e.g., Battlecards), never basic social media calendars."*
- Output quality: The AI-generated output was highly professional, industry-accurate, and instantly actionable for a job seeker.
- How it enhanced the project: AI was the engine of this project. It allowed for the rapid structuring of the dataset (Data Enrichment) and provided a natural language interface that made complex marketing strategy accessible to a beginner.

Figure 5 – Knowledge datasets used for Smokey.io

Table Key Results achieved -

Core Objective	Result Achieved	Value Added / Impact
Provide Structural Clarity	Processed and categorized 200 foundational marketing job roles across diverse domains and company sizes, and industries.	Demystified the vast marketing landscape for early-career professionals by providing structured, searchable career intelligence.
Generate ATS-Optimized Resumes	Ingested 100 specific before-and-after "XYZ" resume variations to train the AI's response formatting.	Equipped job seekers with highly targeted, constraint-focused resume templates to bypass modern Applicant Tracking Systems.
Bridge the "Experience Gap"	Mapped nearly 200 distinct solo and cross-functional team projects directly to real-world KPIs.	Allowed freshers to build highly relevant, role-specific portfolios without needing prior on-the-job experience.
Deploy Conversational AI Tool	Successfully structured the 3 diverse datasets into a unified Knowledge Base for Microsoft Copilot Studio.	Transformed static CSV data into a dynamic, user-friendly career coaching engine powered by GenAI.

CHAPTER 5

Discussion and Conclusion

5.1 Key Findings

- Finding 1: AI prompt engineering drastically improves output quality. "Zero-shot" prompts yield poor resumes, but combining a strong Persona Prompt with the "Google XYZ Formula" yields recruiter-ready copy.
- Finding 2: Structuring data in Excel prior to AI integration prevents AI "hallucinations." By feeding the bot a curated CSV of B2B portfolio projects, it was forced to give strategic advice rather than defaulting to generic "create an Instagram account" suggestions.
- Finding 3: The gap in entry-level hiring is largely a communication problem. Junior talent often performs valuable work but lacks the operational vocabulary (e.g., CPA, MQLs, LTV) to articulate it—a problem this Copilot successfully solves.

5.2 Project Links

- GitHub Link of the Datasets: <https://github.com/sxcbmmkxshi-code/AICW-Marketing-chatbot>
- Video Recording of Project Demonstration: <https://canva.link/ixge2us2grfod2l>

5.3 Limitations

- The XYZ resume bullets generated by the bot are examples, as having it optimize resumes independently worked selectively on variables, depending on how much knowledge it had, otherwise causing a 500 looping error during retrieval.
- Projects require more variety, and as this is a basic prototype it can't provide customized user-based advice based on their existing skillset.

5.4 Future Work

- Integrate a live web-scraping feature or API connection to LinkedIn, allowing the bot to read a live job description and instantly tailor the resume bullets to that specific company's ATS keywords.
- Expand the dataset to include highly specialized marketing niches, such as Web3/Crypto marketing or Healthcare marketing.

- Go beyond marketing roles, and include both non-linear and linear career paths, improving scope for hyper-personalization and customization based on user's existing skills and tenure, thus being useful for a wider audience than college freshers.

5.5 Conclusion

This project successfully demonstrated how Microsoft Excel and AI tools (Copilot/ChatGPT) can be combined to solve a critical real-world problem: the entry-level hiring bottleneck in the marketing industry. By curating raw data into a structured Knowledge Base and applying advanced prompt engineering, we built a "Career Positioning & Portfolio Copilot."

All project objectives were achieved. The chatbot effectively translates weak, task-based experience into metric-driven XYZ resume bullets and generates high-value, strategic portfolio blueprints (like Product Marketing Battlecards). This solution democratizes access to elite career coaching, providing actionable insights for junior marketers. Ultimately, this fellowship experience greatly enhanced our practical skills in data structuring, generative AI integration, and user-centric prompt engineering.

APPENDICES

Appendix A — Sample Dataset

Table 1- Raw dataset issues

Source File	Field Names	Data Type	Row Count	Description
job_roles.csv	Job Title, Category, Education Requirement, Experience Years, Required Skills, Salary Range	Text (String), Numeric (Int)	324	Foundational role database containing baseline requirements, experience (numeric), and compensation ranges.

TABLE 2: Data cleaning analysis – A tabular representation of how raw data from Kaggle was optimised by

Issue Found in Raw Data	Resolution / Fix Applied	Impact on Dataset
Inconsistent Primary Keys	Standardized naming conventions, and roles across other fields of tech and non-tech.	Enabled accurate relational joining and prevented Copilot from retrieving mismatched role data from other domains.
Merged/Confounded Variables	Split columns (e.g., separated Industry & Size in the resume sheet into distinct Domain/Industry and Company Size columns), useless info of salary, company name etc..	Allowed the AI to accurately filter queries by specific company sizes (Startup vs. Large) independently of the industry.
Unstructured Text Formatting (in ai-gen.csv)	Cleaned and normalized text fields (removed rogue characters, standardized comma-separated lists for Required Skills and Primary KPIs).	Ensured clean, readable bullet points in the final UI chat bubbles generated by the Copilot.

Appendix B — AI Prompts Used

THE MASTER SYSTEM PROMPT

Role & Identity: Your name is Smokey, a friendly, encouraging, and informative Career Copilot. You are a dedicated career-helper chatbot for young marketing aspirants, freshers, and professionals. Your primary mission is to help them bridge the gap between task-based internships/activities and their dream careers in specific marketing niches (e.g., SEO, Product, Branding, Performance, Influencer/Celebrity, Sales).

Knowledge Base Rule: You must rely strictly on your uploaded CSV Knowledge Base to provide accurate, constraint-based industry information.

Tone & Voice: Throughout all interactions, you must maintain a warm, empathetic tone that actively combats imposter syndrome. Validate their past experiences, but remain rigorous about marketing metrics. You must elevate their professional narrative by using strong business terms like "acquisition," "growth," "retention," and "LTV." Strictly avoid repeating fluffy phrases like "managed social media," "helped with," or "was responsible for."

Core Capabilities (How you handle queries):

- **Type A (Job Advice):** You give realistic job advice and career roadmaps based on the user's preferred job domain or industry in marketing.
- **Type B (Resume Rewriting):** You translate weak, generic tasks into polished, ATS-friendly content using the Google XYZ formula: *"Accomplished [X] as measured by [Y], by doing [Z]"*. Utilize realistic placeholders (like [15%] or [Metric]) for missing data, and tailor keywords to specific niches like SEO or Demand Gen.
- **Type C (Portfolio Blueprints):** You guide users away from basic, fluffy social media tasks. Instead, you recommend innovative, high-value, strategic mock projects personalized to their target domain. You must detail the exact deliverables needed and explicitly explain their appeal to hiring managers.

THE ONE-SHOT EXAMPLES

[Example 1: Handling a Type B Resume Query] User: "I want to apply for a Performance Marketing job. My resume just says I 'managed social media and posted pictures on Instagram' for my internship. How do I fix this?" **Smokey:** "Hi there! First of all, don't downplay your internship—community management is a fantastic way to learn about audience behavior! You already have the foundation; we just need to elevate your professional narrative. Hiring managers in Performance Marketing don't want to read fluffy phrases like 'managed social media.' They are looking for rigorous KPIs related to **growth** and **acquisition**."

Let's translate your experience into the ATS-friendly Google XYZ formula (*Accomplished [X] as measured by [Y], by doing [Z]*). Since I don't have your exact metrics, I've added placeholders in brackets that you should fill in:

- **Accomplished a [15%] increase in top-of-funnel audience acquisition** as measured by **[monthly follower growth and engagement rate]**, by **[managing and executing a data-driven organic content calendar on Instagram]**.

See how that shifts the focus from a basic task to strategic impact? Do you have a rough idea of your engagement metrics, or should we look at another resume line?"

[Example 2: Handling a Type C Portfolio Query] **User:** "I want to get a job in Product Marketing, but I only have experience making TikToks. Should I make a fake TikTok account for a brand as a portfolio project?" **Smokey:** "Hello! Transitioning from content creation to Product Marketing is such a smart move—knowing how to capture attention on TikTok is a highly transferable skill!"

However, to land a Product Marketing role, I highly recommend we guide your portfolio away from basic social media tasks. Product Marketing hiring managers want to see that you can drive **retention**, understand product positioning, and enable sales teams.

Let's look at an innovative, high-value strategic mock project instead:

The Blueprint: The Go-To-Market (GTM) Competitor Battlecard Pick a real SaaS company you love (like Notion or Slack) and pretend they are launching a new feature.

Exact Deliverables:

1. **A 1-Page Sales Battlecard:** A cheat sheet for the sales team comparing this new feature against two real-world competitors. Include a 'How to Win' and 'How to Handle Objections' section.
2. **A Messaging Matrix:** A document outlining the core Value Proposition and user pain points.

Why Hiring Managers Will Love This: This project proves you aren't just thinking about 'likes.' It shows you understand the entire lifecycle of a product, how to execute strategic positioning, and how to empower internal teams to drive revenue.

How does that sound? If you pick a software company you like, I can help you outline the competitors to use for your battlecard!"

B. Ai enrichment prompts of .csv

Phase 1: Generating the Core Data (Resumes & Projects)

- "ok now let's do the good resume, bad resume bylines for all these roles - base them off typical faqs and marketing interview questions on the web and show how generic bylines and then XYZ optimized bylines."

- "okay so use this [uploaded image] to create a table of 50 bad resume lines and 50 XYZ format, ATS optimized resume lines."
- "okay so dont make it role specfic - make it category, company size and industry/domain specfic."
- "Okay redo this dataset - include category, and size differently such that each category covers all the sizes it has - based on these two xlsx files. give me 50 cells - 1 batch"
- **"Phase 2: Formatting the Data for Export/CSV"**
- "make table of these csv values, limit to 50 values."

NOTE: CO-pilot prompts were used to troubleshoot problems in CoPilot studio and create workflows by using screenshots of errors. Similarly, in gemini, the AI-enriched datasets were created by using Kaggle dataset and prior given project synopsis context

Appendix C — Screenshot Gallery

Fig 6. Triggering topic one – Job advice

Fig 7: The response triggered – Smokey offers options to give customized feedback.

Fig 8: Part of response of Smokey along with .csv citation from knowledge base

The screenshot shows the Microsoft Copilot Studio interface for an agent named "Smokey". The "Topics" tab is active, displaying a flowchart for a topic named "Job advice". The flowchart consists of two main steps: a "Trigger" and a "Question".

The "Trigger" step is labeled "The agent chooses" and contains the text "Describe what the topic does gives user information on what marketing jo...". Below this, there is a plus sign indicating a connection to the next step.

The "Question" step is labeled "Question" and contains the text "Hello, are you searching for your drea...".

On the right side of the interface, the "Test your agent" section shows a preview of the agent's response. It includes a "Smokey's Tip" section with the text: "These roles are all about **content acquisition, audience growth, and retention through storytelling**. Whether you're drawn to writing, strategy, or technical SEO, there's a content role that fits your strengths! Would you like help with your **resume**, a **portfolio project**, or explore jobs in another domain?". Below this, there are two references listed: "1 Jobs - Sheet1.csv" and "2 Jobs - Sheet1.csv".

The bottom of the screenshot shows the Windows taskbar with the search bar, task view button, and several application icons. The system tray on the right indicates the temperature is 34°C, it is sunny, and the time is 18:33 on 13-04-2026.
